

Final Assignment: Create an AI Agent

Due date: October 13th at 11:59PM

Project Overview

In this assignment, you will design, develop, and evaluate an AI agentic system that addresses a real-world problem. This project is for us to evaluate your learning in agentic AI concepts and provide hands-on experience with autonomous AI systems.

Project Requirements

1. Problem Identification & Agent Development

Target: Create a functional AI agentic system that solves a specific, well-defined problem. This problem can be a problem that you have, a problem that your friend has or a problem that a business has.

Acceptable Platforms: Students may use any no-code/low-code platforms (we suggested n8n) or even coding approaches. The focus is on agent design and behaviour, not technical implementation complexity.

2. Deliverable Components

Description & Explanation

- Clear problem statement and justification for an agentic solution
- Target audience and use case definition
- Expected outcomes and success criteria

Agent Development

- System architecture overview (visual diagrams encouraged)
- Agent capabilities, tools, and decision-making processes
- Implementation approach and platform justification
- Screenshots/demonstrations of the working system

Behavioral Evaluation

- Analysis of agent strengths and limitations
- Multiple agent execution path (avoid golden path)

Conclusion

- Summary of key findings and project outcomes
- Assessment of whether objectives were met

Recommendations

- Suggestions for system improvements
- Potential risks
- Next steps for the project or the next developer

Insights & Reflections

- Personal learning outcomes
- Challenges encountered and lessons learned
- Implications for future agentic AI applications

Submission Format

- **Video submission:** 10-minute walkthrough of your AI agent, including all of the deliverable components.
